

# Predicting the Popularity of Web 2.0 Items based on User Comments

Xiangnan He, Ming Gao, Min-Yen Kan, Yiqun Liu and  
Kazunari Sugiyama

National University of Singapore  
Singapore Management University  
Tsinghua University

# User Generated Content: A driving force of Web 2.0

## Challenges:

- Information overload [1]
- Dynamic, temporally evolving Web
- Rich but noisy UGC

## Daily growth of UGC:

- Twitter: 500+ million tweets
- Flickr: 1+ million images
- YouTube: 360,000+ hours of videos

# Dynamic, temporally evolving Web

## – Challenges in Web search ranking

- Illustrative Example:

Querying “The Voice of China” on 2013/7/24

(A Chinese reality talent show started in 2012 – 1 season/year)

[Top 3 results of Google constrained in YouTube domain]

**The Voice Of China ! Never thought someone shall sing like that ...**

72

Top results are all old popular videos of the last season, only attract less than 10k views in future 3 days.

First result of the new season

Ranked 16<sup>th</sup>, but extremely popular  
(more than 100k views)

# Why Popularity Prediction?

# Why Popularity Prediction?

- Traditional solutions - mining the view histories of items.
- However, it is not easy to perform prediction when one is not the content providers:
  - ❖ View histories are cost to build (need repeated crawling)
- Our proposal -- predicting popularity (view # as metric) based on user comments, which are more easily accessible than views.

# Why user comments?

- Comments contain signal of item's future popularity:
  - Commenting timestamps.
  - Commenting users.
  - Textual comments.

## Imagine Dragons - Demons (Official)

Where my diamonds hide....

## DAVID GATES (of BREAD) performs "If" (Live in 1975)

**John Dahlin** 15 hours ago **15 hours ago**  
I love the video but the gay commercial that preceded it made me sick.

**Eddie Garcia** 1 day ago **1 day ago**  
Simply beautiful!!! There's no Singers/composers like him today.

**Brian Burton** 2 days ago **2 days ago**  
tis you terry

**shiutan chan** 1 week ago  
It's a beautiful song

**olo brown** 1 week ago  
I couldn't find the words except... "BEAUTIFUL!"

# Comments Vs. Views

- Intuitively, comment series should have correlation with view series.

A sample video's statistics in YouTube

- Q1: Can *comment series* be used to replace *view series* for prediction?
- Q2: How the past user comments contribute to future popularity?

# Correlation of Comments and Views

- Q1: Can *comment* series be used to replace *view* series for prediction?

*Comment history is highly correlated with view history!*

CDF of videos with respect to their comments-views correlation.

# Comment Series Autocorrelation

- Q2: How past user comments contribute to future popularity?

*Comment histories can reflect future popularity in the near-term, and that its predictive ability decreases with a larger lag.*

Autocorrelation of comment series

# Prediction Based on Comment Series

- Intuitive Solution: adopt time series prediction methods (e.g. regression) on comment series.

- Problem: Sparsity!!
  - Many items have no comments at particular time unit.

- We need to incorporate more SIGNALs for quality prediction!

# Outline

- Goal and Motivation
- Preliminary analysis
  - Correlation analysis of comments and views
  - Autocorrelation analysis of comment series
- Proposed Method
  - Hypotheses on comment-based prediction
  - Bipartite User-Item Ranking (BUIR)
- Experiments
- Conclusion

# Hypotheses on Comment-based Prediction

- H1. Temporal factor: More recent comments -> More likely to be popular;
- H2. Social Influence factor: More influential the commented users -> More likely to be popular [4];
- H3. Current Popularity factor: More current popularity is -> More likely to be popular (“rich-get-richer” effect).

# Proposed Solution – *BUIR*

- Bipartite User-Item Ranking:
  - Modeling user comments as a bipartite graph;
  - Ranking items by capturing the three hypotheses (i.e. ranking by predicted popularity [2]).

Example: Bipartite User-Item Structure

Edge weight:

$$w_{ij} = \delta^{a(t_0 - t_{ij}) + b}$$

# BUIR – *Regularization framework*

- Devising regularizers for three hypotheses:
  - H1. Temporal factor (more users commented on recently)
  - H2. Social influence factor (more influential users)
  - H3. Current popularity factor (more popular now)
- Capturing H1 & H2:
  - If an item is **recently** commented by **many influential** users, it should be ranked high.

$$\frac{1}{2}\eta \sum_{j=1}^{|P|} \sum_{i=1}^{|U|} \boxed{w_{ij}} \left( \frac{1}{\sqrt{d_j^p}} p_j - \frac{1}{\sqrt{d_i^u}} u_i \right)^2$$

# BUIR – Regularization framework

- Devising regularizers for three hypotheses:
  - H1. Temporal factor (more users commented on recently)
  - H2. Social influence factor (more influential users)
  - H3. Current popularity factor (more popular now)
- Capturing H2 & H3:

$$\alpha \sum_{j=1}^{|P|} (p_j - p_j^0)^2 + \beta \sum_{i=1}^{|U|} (u_i - u_i^0)^2$$

Item's initial score

$$p_j^0 = \frac{\log v_j}{\sum_{k=1}^{|P|} \log v_k}$$

User's initial score

$$u_i^0 = \frac{\log(1 + g_i)}{\sum_{k=1}^{|U|} \log(1 + g_k)}$$

# BUIR – Iterative solution

- Regularization function to minimize:

$$R = \frac{1}{2}\eta \sum_{j=1}^{|P|} \sum_{i=1}^{|U|} w_{ij} \left( \frac{1}{\sqrt{d_j^p}} p_j - \frac{1}{\sqrt{d_i^u}} u_i \right)^2 + \alpha \sum_{j=1}^{|P|} (p_j - p_j^0)^2 + \beta \sum_{i=1}^{|U|} (u_i - u_i^0)^2$$

- Alternating optimization:

- Iterative updating rules:

$$p_j = \frac{2\alpha}{\eta + 2\alpha} p_j^0 + \frac{\eta}{\eta + 2\alpha} \sum_{i=1}^{|U|} \frac{w_{ij} u_i}{\sqrt{d_j^p} \sqrt{d_i^u}}$$

$$u_i = \frac{2\beta}{\eta + 2\beta} u_i^0 + \frac{\eta}{\eta + 2\beta} \sum_{j=1}^{|P|} \frac{w_{ij} p_j}{\sqrt{d_j^p} \sqrt{d_i^u}}$$

- Guarantee to find the global minima (the Hessian is positive semi-definite).

# Interpretation of BUIR

- Matrix form of the iterative solution:

$$\mathbf{p} = \frac{1}{1 + 2\alpha} \mathbf{S}_w^T \mathbf{u} + \frac{2\alpha}{1 + 2\alpha} \mathbf{p}_0,$$

$$\mathbf{u} = \frac{1}{1 + 2\beta} \mathbf{S}_w \mathbf{p} + \frac{2\beta}{1 + 2\beta} \mathbf{u}_0.$$

- where  $S_w = [\frac{w_{ij}}{\sqrt{d_j^p} \sqrt{d_i^u}}]_{m \times n}$
- Mutual reinforcement between users and items:
  - Comment by a user increases the target item's score;
  - The item increases the user's score (n.b. activity degree).
- Random walk in the bipartite graph
  - Can be seen as a variant of PageRank

# Outline

- Goal and Motivation
- Preliminary analysis
- Proposed Method
- Experiments
  - Overall Evaluation
  - Query-specific Evaluation
  - Tiered Popularity Evaluation
- Conclusion

# Experiments - Settings

- Datasets:

- Search results of 10 queries.

Dataset	# Item	# Comment	# User	Avg C:I
YouTube	21,653	7,246,287	3,620,487	334.7
Flickr	26,815	169,150	37,690	6.3
Last.fm	16,284	530,237	77,996	32.6

- 10%: Parameter tuning in regularization, 90%: Testing.

- Crawled on two dates:

- Initial date ( $t_0$ ) and Evaluation date ( $t_0 + 3$ )
- Ground-truth is the #view received between the two dates.

- Evaluation metrics:

- Spearman coefficient and NDCG@10 (query-specific evaluation)

# Experiments - Baselines

- Compare with 5 methods:
  - VC: Rank based on current **View Count** (corresponds to H3).
  - CCP: **Comment Count** in the **Past 3 days** (corresponds to H1).
  - CCF: **Comment Count** in the **Future 3 days** (oracular method with access to future comments).
  - ML: **Multivariate Linear** regression model proposed by Pinto et al. 2013 [3] (current state-of-the-art method).
  - PR: **PageRank** (with personalized vectors) in the user-item graph.

# Overall Evaluation

Spearman coefficient (%) of ranking all items

	YouTube	Flickr	Last.fm
VC	73.39	58.42	67.31
CCP	83.35	59.43	67.21
CCF	84.53	59.41	67.20
ML	78.24	58.00	38.09
PR	80.72	28.15	10.24
<b>BUIR</b>	<b>87.72**</b>	<b>64.60**</b>	<b>70.43**</b>

2. VC obtains good performance, indicating effectiveness of H3

3. Difference between CCF and CCP are insignificant.

4. ML does not perform well:  
➤ Short-term prediction;  
➤ Optimization criterion (mRSE VS. Ranking)

5. Separately handling two vertex types in bipartite graph is important!

1. BUIR performs best in all datasets ( $p < 0.01$ ).

# Case Study of Top Rankings

- Abnormal items in top rankings:
  - “Lady Gaga” and “Madonna”, ranked at 4<sup>th</sup> and 7<sup>th</sup> by BUIR, but their true rank is 170<sup>th</sup> and 178<sup>th</sup>, respectively.

ChrisFM101

I want her songs!

*When items receive uneven high ratio of comments to views, our comment-based method may be misled into incorrect rankings.*

tists  
s,

Bastiano

Just Dance is great <3

anthonyinstereo

i saw her perform at Le Royale in NYC randomly...  
wish she'd put the other songs online.

Comments of Lady Gaga in Last.fm

# Query-specific Evaluation I

NDCG@10 (mean  $\pm$  standard deviation) of 10 queries

	YouTube	Flickr	Last.fm
VC	<b>64.70<math>\pm</math>22.23*</b>	<b>67.19<math>\pm</math>15.75*</b>	<b>90.25<math>\pm</math>4.96*</b>

*Current View Count is a good prediction indicator for most popular items!*

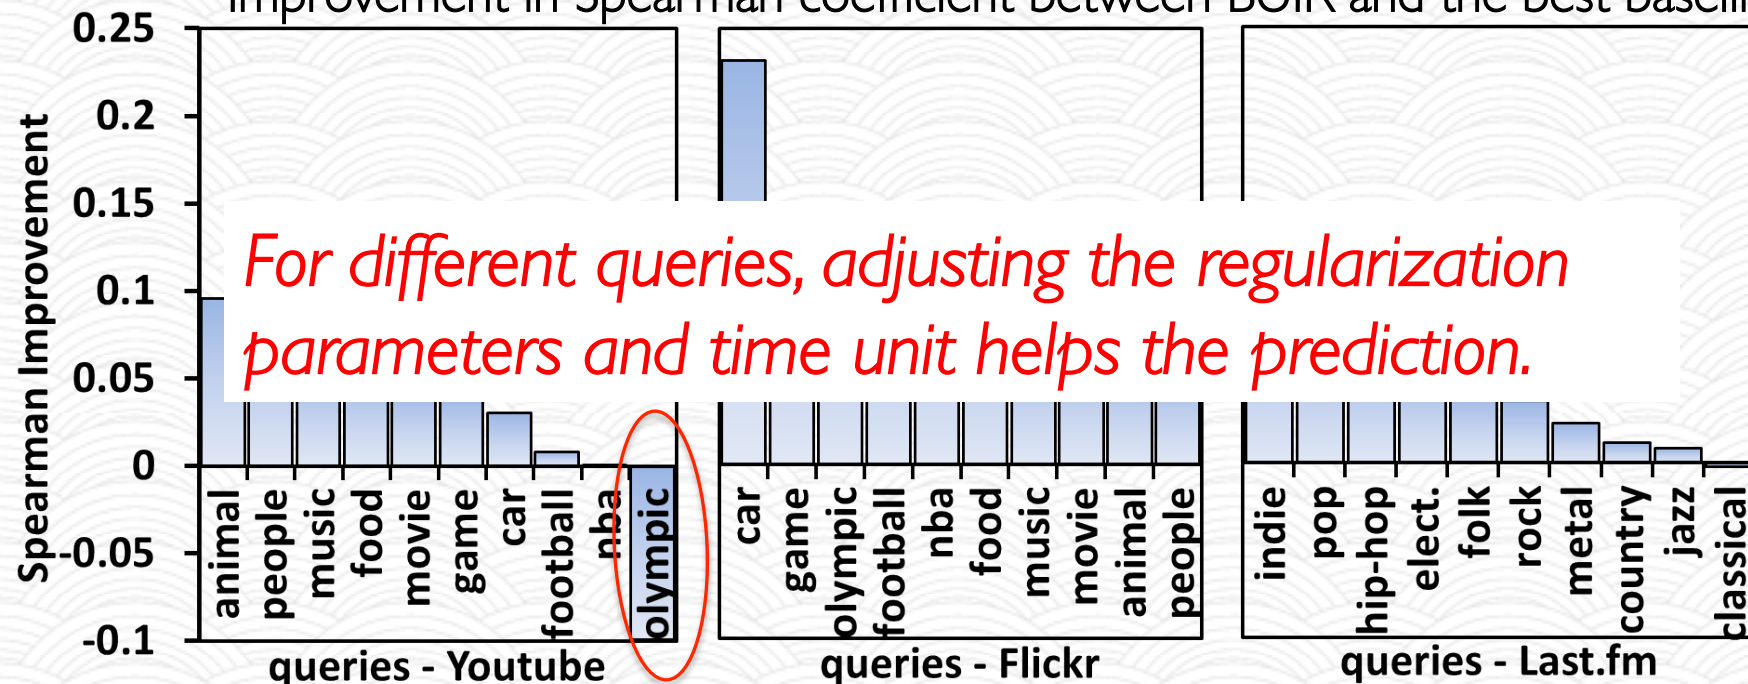

ML	27.85 $\pm$ 30.76	50.74 $\pm$ 18.64	74.30 $\pm$ 11.15
PR	61.10 $\pm$ 21.92	54.53 $\pm$ 22.62	81.16 $\pm$ 10.07
BUIR	<b>76.13<math>\pm</math>12.29*</b>	<b>74.19<math>\pm</math>15.70*</b>	<b>88.19<math>\pm</math>4.68*</b>

\* denotes the statistical significance for  $p < 0.05$

# Query-specific Evaluation II

Improvement in Spearman coefficient between BUIR and the best baselines

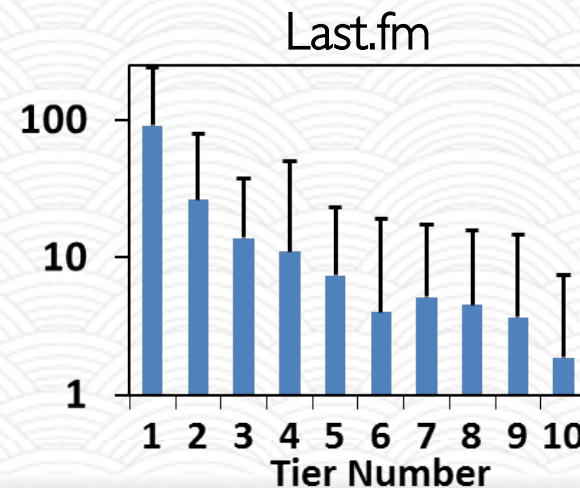

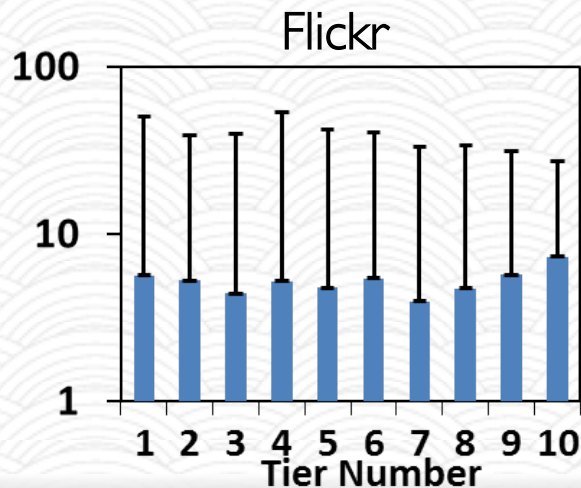

## Reasons:

1. London Olympic event – users commented according to their country's medaling – H2 (social influence factor) does not hold.
2. Freshness – for these new videos, when we change the time unit to hourly basis, our method improves.

# Tiered Popularity Evaluation

- Experimental Settings
  - Step 1: Sort the items by descending view count at the ranking time;
  - Step 2: Split items into ten equal-sized subsets: Tier-1 (most popular) to Tier-10 (least popular).
- Comment statistics of the ten popularity tiers:

# Tiered Popularity Evaluation

*For less popular items, neither the current views nor recent comments is sufficient for quality prediction – it is important to incorporate more signals, such as social influence!*

1. BUIR consistently performs better, and the improvement over CCP and CCF are more noticeable for high tiers (less popular items);
2. VC predicts well for popular items, but suffers a lot for less popular items.
3. CCF does not always outperform CCP, although CCF utilizes future knowledge, indicating the limitation of simply using comment count for prediction.

# Hypotheses Study

Performance decrease of different parameter settings

	YouTube	Flickr	Last.fm

*Every factor captured in BUIR — H1, H2 and H3 — is necessary for high-quality popularity prediction based on user comments.*

$\alpha, \beta = 0$	51.24 (-42 %)	53.77 (-17 %)	47.22 (-33 %)
---------------------	---------------	---------------	---------------

# Conclusion and Future Work

- Systematically studied how to best utilize user comments for predicting popularity of Web 2.0 Items.
  - ✓ H1. Temporal factor (fundamental assumption)
  - ✓ H2. Social Influence factor (good signal for less popular items)
  - ✓ H3. Current popularity factor (good signal for popular items)
- Proposed BUIR ranking algorithms for bipartite graphs:
  - ✓ Convergence and global optimum guaranteed.
  - ✓ Easily extended to incorporate more hypotheses.
- Future work:
  - Can comment content (relevance and sentiment) aid prediction?
  - Operationalize our comment-based prediction and clustering (see my WWW'14 work) into contextual advertising and recommender system.

# ADDITIONAL SLIDES

# Query-specific Evaluation I

Spearman coefficient (mean  $\pm$  standard deviation) of 10 queries

	YouTube	Flickr	Last.fm
VC	71.98 $\pm$ 14.14	46.72 $\pm$ 7.82	67.86 $\pm$ 5.76
CCP	82.41 $\pm$ 2.50	48.06 $\pm$ 7.90	66.97 $\pm$ 4.70
CCF	<b>83.42<math>\pm</math>2.7*</b>	48.12 $\pm$ 7.80	67.27 $\pm$ 4.45
ML	76.95 $\pm$ 5.50	50.00 $\pm$ 6.50	39.15 $\pm$ 4.04
PR	79.66 $\pm$ 4.72	27.80 $\pm$ 14.87	9.22 $\pm$ 11.66
<b>BUIR</b>	<b>85.98<math>\pm</math>5.92*</b>	<b>55.22<math>\pm</math> 6.10*</b>	<b>70.42<math>\pm</math>4.43*</b>

“\*” denotes the statistical significance for  $p < 0.05$ .
