## Combinatorics, 2016 Fall, USTC Homework 8

- The due is on Tuesday, Nov. 22, at beginning of the class.
- Solve all problems.

1. Find the maximum number of line segments that a Hasse diagram of poset $(X, \prec)$ with $|X|=n$ can have. Then define a poset which achieves this maximum number and draw its Hasse diagram.
2. For two natural numbers $a, b$, the symbol $a \mid b$ means that " $a$ divides $b$ ". In other words, there exists a natural number $c$ such that $b=a c$. First verify that the relation "" is a partial ordering on the set $\mathbf{N}$ of natural numbers. Then prove that every finite poset can be embedded into ( $\mathbf{N}, \mid)$.
3. For any point $p \in R^{d}$ in $d$-dimension, write $p=\left(p_{1}, p_{2}, \ldots, p_{d}\right)$. A set $\mathcal{P}$ of points in $R^{d}$ is called good, if for each $i \in[d]$, the $i^{\text {th }}$ coordinates of these points are distinct. Given two points $p, q \in R^{d}$, define $\operatorname{box}(p, q):=\left\{x \in R^{d}: \min \left\{p_{i}, q_{i}\right\} \leq x_{i} \leq \max \left\{p_{i}, q_{i}\right\}\right.$ for each $\left.i\right\}$ as the box determined by points $p, q$.

Prove that in any good set $\mathcal{P}$ of $2^{2^{d-1}}+1$ points of $R^{d}$, there is a point $x \in \mathcal{P}$ which is in the box determined by two of the other points in $\mathcal{P}$.
4. For any integers $k, l \geq 1$, construct a sequence of $k l$ distinct integers with no increasing subsequence of length $k+1$ and with no decreasing subsequence of length $l+1$.
5. Let $P=(X, \prec)$ be a finite partial ordered set. Show that $X$ can be expressed as a disjoint union of at most $\alpha(P)$ chains.

Hint: by induction on $|X|$.
6. Construct an explicit 2-edge-coloring of $K_{k l}$ to show that $R(k+1, l+1) \geq k l+1$.
7. Use Ramsey's theorem to prove: for every integer $k \geq 2$, there is an integer $n$ such that every sequence of $n$ distinct real numbers contains a monotone subsequence of $k$ real numbers.
(You must use Ramsey's theorem and cannot use the Erdős-Szekeres theorem.)
8. For integers $k \geq 2$ and $s_{1}, s_{2}, \ldots, s_{k} \geq 2$, the Ramsey number $R_{k}\left(s_{1}, s_{2}, \ldots, s_{k}\right)$ is the least number of integer $n$ such that any $k$-edge-coloring of $K_{n}$ has a monochromatic clique $K_{s_{i}}$ in color $i$. Prove that for any integers $s_{1}, s_{2}, \ldots, s_{k} \geq 2$, the Ramsey Number

$$
R_{k}\left(s_{1}, s_{2}, \ldots, s_{k}\right)<+\infty
$$

9. Prove that $2^{k} \leq R_{k}(3,3, \ldots, 3) \leq(k+1)$ !
